

## **The European project FEET IN 4.0 continues its development in the field of Industry 4.0**

The European FEET IN 4.0 project continues as planned, having reached one third of its duration. During this time, multiple activities have been carried out in collaboration with companies in the footwear sector in Portugal, Poland, Italy and Spain in order to optimise the future final results of the project and maximise its impact.

After carrying out a study of the current implementation of industry 4.0 technologies in the footwear sector, surveys were carried out among the companies in the sector in order to be aware of their knowledge on new technologies and which may be more interesting for modernising industrial processes and improving their efficiency in footwear production.

Once the information about the Industry 4.0 in the footwear sector and in the manufacturing companies was collected, the main professional profiles present in most of the companies were analysed, including the study of their current training and their necessary skills for the future.

This analysis will serve as a starting point to developing the customised training that will be created in the coming months for each professional profile, with the priority objective of enabling workers to enter the digital age in their jobs and be able to take advantage of the opportunities offered by Industry 4.0.
